File ‘oligomer_22_perturbation.py’ generates the data. I change:

```
L_max = 5
M = 3
monomer_C0 = [0.192,0.192,0.076]

deltaG_act_kcal = [25,28.5,35]
deltaG_std_kcal = [7,5.0,3]
deltaG_exch_act_kcal = [31,33.0,36]

"delta_T": 0.0
```

File ‘plot_perturbation’ reads the data and plots it in many ways. It spills through the terminal the values for Figure 4, which can then be plotted using ‘perturbation_figure_4.py’. It also makes the plots for Figure 1, but not properly normalyse. To get the final version of Figure 1, use ‘perturbation_figure_1.py’, which needs the perturbed and the non-perturbed data as input.

‘perturbation_figure_1.py’ used threshold detection 0.00001 (for heptamers), ‘perturbation_figure_4.py’ used 0.0001 (for pentamers)

The data is saved in the folders Figure1_final and Figure4_final.
